

10.1.2 Reverse String

ALGORITHM

Step 1 : Start

Step 2 : Input string and store in user_string

Step 3 : Set result as an empty string

Step 4 : Find length of user_string and store in l

Step 5 : Set i = l - 1

Step 6 : Repeat steps while i is greater than or equal to 0

Step 7 : Get the character at index i from user_string

Step 8 : Add the character to result

Step 9 : Decrease i by 1

Step 10 : Go back to Step 6

Step 11 : Print result

Step 12 : Stop

10.1.2. Reverse a String

08:02

Write a Python program that prints the reverse of a given input string. The program uses a `reverse_string()` function that takes a string as input and returns its reversed string.

Input Format:

- The program prompts "Enter a string: " and reads a string representing the string to be reversed.

Output Format:

- The first line prints the original string, in the format:
`Original String: <input_string>`
- The next line prints the reversed string, in the format:
`Reversed String: <reversed_string>`

Sample Test Cases

ReverseS...

```
1 def reverse_string( input_string ):
2     return input_string[::-1]
3
4 user_input = input("Enter a string: ")
5 result = reverse_string(user_input)
6 print(f"Original String: {user_input}")
7 print(f"Reversed String: {result}")
```
